

New checkpoint → serves the next case (`_load_model.cache_clear()`)

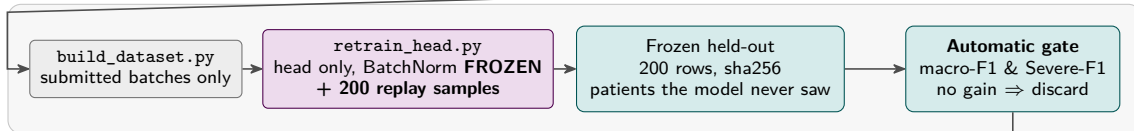

A. SERVING — the app in use

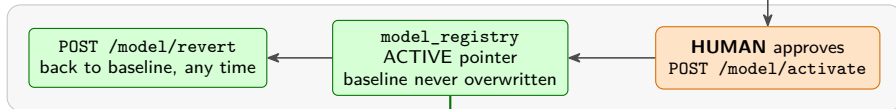

B. COLLECTION — “save” is separate from “submit”

C. OFFLINE — batch update, verified before it counts

D. DEPLOYMENT — a person decides, and it is always reversible

Every box here is implemented and tested. Orange = a person is in the loop.

Updates are **batched**, not online: the serving model does not change when the radiologist clicks Save.
